WHAT IS VST?

Verification Systems Technology (VST) is an independent third party company that can quickly and accurately detect and identify counterfeit and modified IT hardware. The most recent industry research estimates that nearly 10% of all the IT hardware is counterfeit. Initial VST testing has determined that some specific IT product lines are nearly twice as high (about 20%) VST's business objective is to perfect, protect, and deploy the technology tools in order to assist clients in detecting and identifying counterfeit and modified IT hardware and thereby contributing to the integrity of world wide supply channels.
